Professional Summary

- 7 Years of Full-Stack & Backend Experience: Specialized in distributed microservices, fraud risk management, and enterprise platform engineering.
 - Proven Delivery & Technical Leadership: Led end-to-end launch of regional fintech/insurance features and company-wide developer documentation hubs.
 - Team player that can collaborate globally, communicate across domain to solve problem effectively and adaptively
 - Core Tech Stack: Golang, C#, ASP.NET, Java Spring boot, Python, AngularJS, ReactJS, Node.js, Kubernetes, AWS, GCP, Redis, PostgreSQL, Docker, Graph DB
-

Work Experience

GRAB

Software Engineer (Fullstack Engineer)

Jakarta, Indonesia April 2024 - Now

- Led and end to end launch of Ride Cover Plus in Philippines (one of insurance products in Grab), responsible for managing the engineering side of the project, creating tasks for other engineers within and outside the team, managing stakeholders (product manager, data analysts, third party insurer). With this product we pulled around new 31.000 transaction in 2 weeks since launched
- Led engineer in creating a new Technical Documents site for the whole Grab documentation. Migrated all the docs to a more simpler and efficient way, using Hugo as a static site. As the first engineer working on this I prepare the technical side, such as migration strategies, deployment, infrastructure and network creation. Currently it is used widely across Grab daily by engineers and others, with integrated MCP, fast AI search, etc.
- Led an initiative to clean and reduce friction between product team, content team and engineer in populating content shown to user, by streamlining workflow between them when it comes to adding, modifying content in frontend. The system automatically syncs between platforms that each team uses, therefore reducing back and forth discussion and review between each stakeholders.
- Addition to above, i also worked on standardizing the current content translation content to have the same key all over the platform, this also aim to reduce friction and confusion between engineers and the content team
- Worked on a team for entity cataloging and hub for tech services across Grab. Mainly used for service related cost, ownership, API, Tech docs, service to service relations, etc.

TOKOPEDIA

Software Engineer (Backend engineer)

Jakarta, Indonesia *September 2021 - April 2024*

- Served in Risk Management as a key member of the Account Security Team at Tokopedia, safeguarding users from undesirable activities within the Tokopedia ecosystem, including but not limited to account takeover, external fraud, social engineering, system abuse, and unauthorized login.
- Conceptualized and implemented a real-time rule-based system by utilizing golang, Redis, Postgres, NSQ, Neo4j to identify suspicious transactions/orders within Tokopedia. Employing concurrency and a caching mechanism, this feature efficiently analyzes every order, successfully mitigating potential customer losses due to fraudulent activities. This initiative has resulted in monthly savings of approximately 120 million IDR for Tokopedia users.
- Developed a user-friendly dashboard using ReactJS for the aforementioned system. This dashboard enables the business team to analyze applied rules for continuous improvement, while also assisting administrators in filtering out false positives. This has led to a 90% reduction in manual work time, as all necessary data is compiled and presented seamlessly.
- Designed and implemented a service to systematically by using Golang, Redis, SMTP, report all technical incidents occurring throughout Tokopedia. This service aggregates extensive data from PagerDuty and the internal employee database, meticulously processing metrics such as Mean Time to Acknowledge (MTTA), Mean Time to Resolve (MTTR), responsiveness, resolutions, and more for all teams across Tokopedia's diverse tribes. The compiled insights are delivered to organizational leaders weekly, providing a comprehensive overview of the Tokopedia system's overall health. Monthly summaries facilitate rapid prioritization in addressing recurring incidents, establishing this reporting system as a crucial benchmark for determining Tokopedia's acceptable standards for MTTA and MTTR.

EximBank (Indonesia Export Import Bank)

Software Engineer Fullstack

Jakarta, Indonesia *June 2019- September 2021*

- Developed a web application to streamline document handling, approval, and delegation, resulting in a significant increase in workflow efficiency by eliminating the reliance on physical paperwork.
- Designed and implemented a web application to facilitate export/import insurance processes between Eximbank and PLN.
- Utilized a tech stack comprising for the development of the aforementioned web applications.

Education

Institute of Technology Sepuluh Nopember, Surabaya

Geophysics Engineering

September 2014- September 2018

Projects

Link: xenosumedia.com

Repo : <https://github.com/rizkiawanAldo/Xenosumedia>

Develop a website for my personal photography portfolio

Link: <https://rizkiawanaldo.github.io/image-reducer/>

Repo: <https://github.com/rizkiawanAldo/image-reducer>

An online tool for reducing any image size down to 1MB, no need to upload to any server, reliable, and do what it does.

Repo: <https://github.com/rizkiawanAldo/brightness-bridge>

An offline tool for windows to control external monitor brightness level.
